# Cluster Progress

October 21, 2019

# CE Offline

- The fans were cleaned, but this didn't seem to have an effect.
- The PSU's don't seem to be the issue, as was initially suspected.
  - The PSU's in the CE and the SE were identical, so I swapped the working PSU's from the SE into the CE.
  - There was no change in the state of the CE, unfortunately.
- When the power button is pressed, all hard drive slot LED's light up even if the slot is empty.
- This issue is still under investigation to find the root cause and a potential fix.

# NAS-1 Controller Failure

- The RAID Controller has again entered a crit fail state, though NAS-1 isn't in emergency mode this time.
- This issue is still under investigation as well.
